March 2020 Project Initiation – Two-year time frame

The Problem

- Too much reliance on published PDF “supplemental information” without concern for interoperability
- No central community-based effort to archive and make available spectroscopic data
- No standards for describing or relating that data to chemical structure

March 2020 Project Initiation – Two-year time frame

The Task – To do what IUPAC does best

- Develop a standard vocabulary and structure in the area of chemistry
- Enable others to implement area-specific value-added services
- Enable services to work together using a shared set of data descriptors and protocols

first year **design**; second year **build**

Design Decisions

1. This project is not about the creation of any new file formats
2. We will not limit ourselves to one specific spectroscopic technique.
3. We recognize four key pieces of the puzzle.
 - the spectroscopic data itself
 - associated chemical identifier/structure-related (meta)data
 - associated structure-spectrum analysis (meta)data
 - associated general key/value pair metadata (authors, associated DOIs, provenance, licenses, etc.)
4. We recognize the importance of multiple representations.
 - drawing from successes in earth science and archival science
 - varieties of spectroscopic data representations
 - key aspects of acceptable chemical identifiers and structure formats

Design Decisions

5. We recognize the importance of a ***collection*** and its associated ***finding aid***.
 - drawing specifically from archival science
 - an isolated manufacturer data set has no intrinsic value
 - connection to an appropriate chemical identifier is critical
 - connection to related spectra and compounds is valuable
 - key element is a structured finding aid
6. We will work closely with known (meta)data managers and other stakeholders, ensuring that whatever we do is mappable to their metadata as much as possible.
 - publishers and authors (ACS, RSC)
 - repository and database managers (HMDB, BMRB, NP-MRD, NMRShiftDB, nmrdB)
 - chemical information services (PubChem)

The IUPAC FAIRSpec Specification, Version 0.0.1

Robert M. Hanson, Damien Jeannerat, Mark Archibald, Ian Bruno, Stuart J. Chalk, Antony N. Davies, Robert J. Lancashire, Jeff Lang, Henry S. Rzepa

[draft version 2021.08.06]

<https://docs.google.com/document/d/1WYB3f04dFdVzlvf7aEwdVNwEwLpQ7YBAA00pGbc8Jp0/edit?usp=sharing>

1. Basic IUPAC FAIRSpec Principles
2. Preferred Collection Organization
3. The IUPAC FAIRSpec Metadata Model
4. Data and Metadata Extraction and Serialization
5. The IUPAC FAIRSpec Data Model

1. Basic IUPAC FAIRSpec Principles

1.1 FAIR spectroscopic data management should be an ongoing concern

- part of the design of an **ongoing scientific endeavor**
- **intrinsic value** in real time to the originating research group(s)
- should **allow for cycles of data *generation*, (re)*processing*, and (re)*analysis***
- requires **distributed curation**

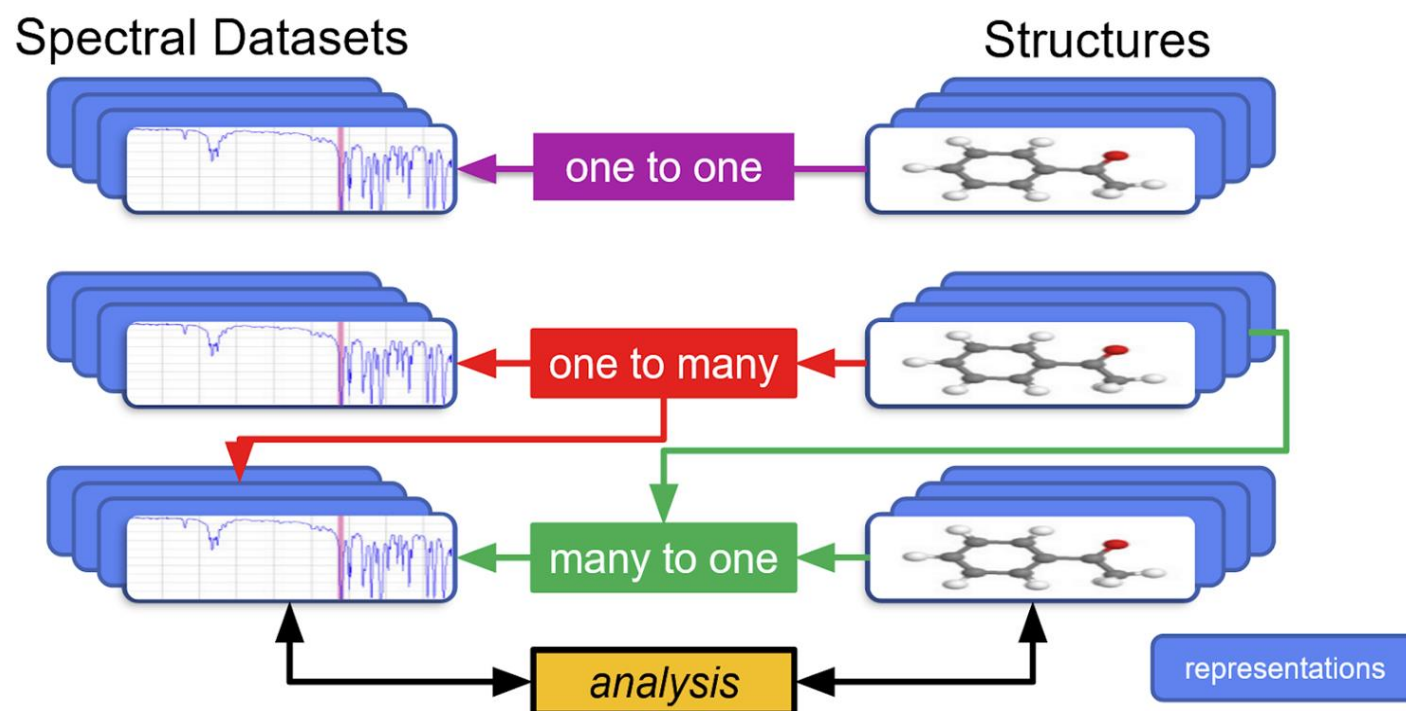

1. Basic IUPAC FAIRSpec Principles

1.2 Context is important

- emphasize the **value of a collection**
- emphasize the **connection between chemical structure and chemical properties**
- allow for the fact that **spectroscopic relationships develop over time**

One to One and One to Many FAIR Relationships

INTERNATIONAL UNION OF
PURE AND APPLIED CHEMISTRY

This page is a demonstration page for **IUPAC Project 2019-031-1-024**, *Development of a Standard for FAIR Data Management of Spectroscopic Data*. It uses **IUPAC FAIRSpec Finding Aids** created by a test IFSExtractor on our [GitHub site](#). This is only a very minimal test involving 13 supporting information data sets from the **ACS FAIRData pilot**.

Technical Appendix

1. Basic IUPAC FAIRSpec Principles

1.3 FAIR data management standards should be modular, extensible, and flexible

- *modular*, allowing for core standards to be **developed in different subdisciplines**
- *extensible*, expressing clear versioning and allowing for **future needs**
- *flexible*, **respecting variety** and should not require one particular data format

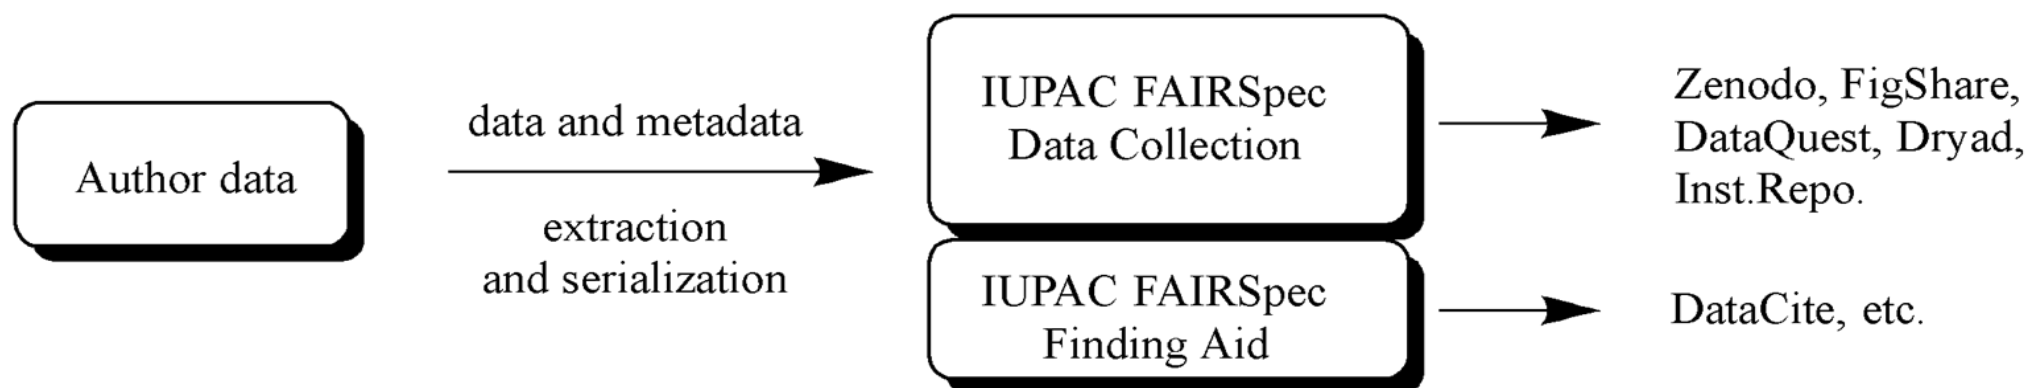

jcamp-dx

1. Basic IUPAC FAIRSpec Principles

1.4 Findability, Accessibility, Interoperability, and Reusability does not stop at the ZIP file

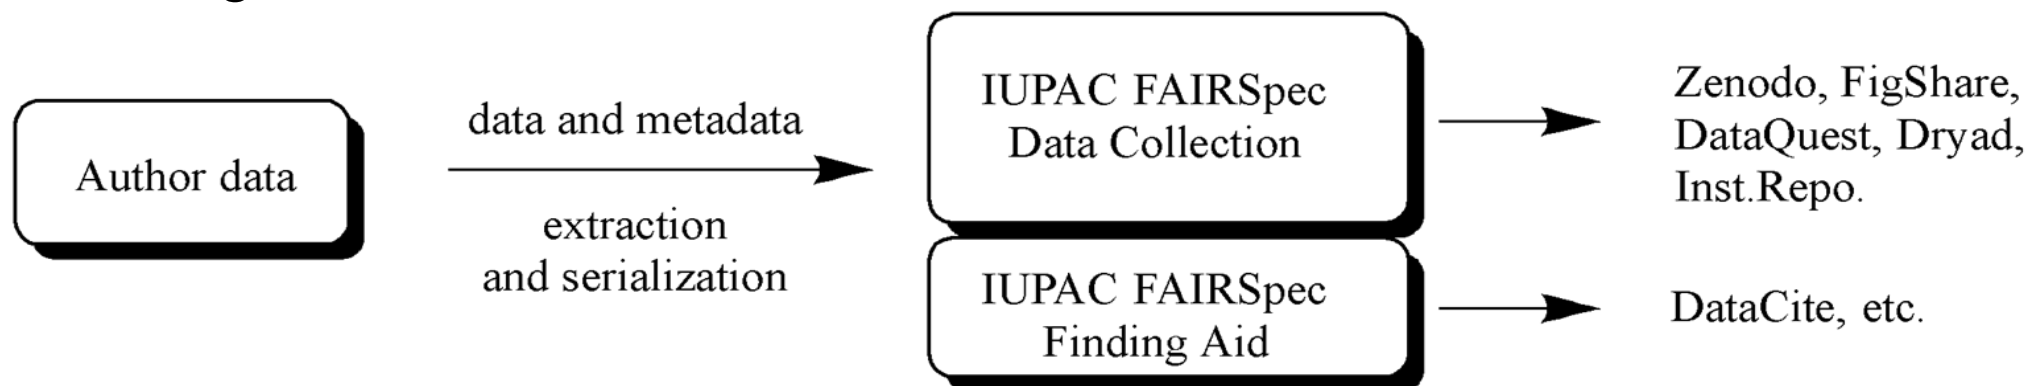

- the standard should describe a **digital *finding aid*** that allows a reuser to quickly ascertain whether additional scrutiny of the data collection is warranted
- the standard should **allow for repackaging** or "extraction" of metadata and other digital objects from an original dataset in order to provide a better reuser experience

1. Basic IUPAC FAIRSpec Principles

1.4 Findability, Accessibility, Interoperability, and Reusability do not stop at the ZIP file

- standard must be clearly defined and, as much as possible, **mappable onto other metadata standards** that are in use or will be in future – FAIR as “Fully Artificial Intelligence Ready”
- standards should respect the fact that data can have **multiple representations**, as reuse of data relies upon data being in a form that is meaningful *for the reuser*.
